

Banker's Algorithm Implementation

Documentation Overview

This documentation describes an implementation of the Banker's Algorithm for deadlock avoidance in C++. The solution consists of a single program that:

1. Reads resource allocation data from a file
2. Implements the Banker's Algorithm to determine if the system is in a safe state
3. If safe, outputs the safe sequence for process execution

The implementation uses a step-by-step approach to track resource allocation and determine a safe execution sequence.

System Architecture

Data Structures

// Process resource allocation matrices

vector<vector<int>> allocation; // Currently allocated resources

vector<vector<int>> max; // Maximum resources each process might request

vector<vector<int>> need; // Resources still needed (max - allocation)

// Resource availability

vector<int> available; // Currently available resources

vector<int> totalResources; // Total resources in the system

// Safe sequence tracking

vector<int> safeSequence; // Stores the safe execution order

vector<bool> finish; // Tracks which processes have completed

Implementation Details

File Format

The input file (banker_data.txt) contains:

- Allocation matrix (5 rows × 3 columns)
- Maximum request matrix (5 rows × 3 columns)

- Available resources (1 row × 3 columns)

Key Functions

- `main()`: Sets up data structures, reads input file, and executes the algorithm
- `isSafeState()`: Core function that implements the Banker's Algorithm

Algorithm Explanation

The Banker's Algorithm works as follows:

1. Initialization:
 - Read allocation matrix, maximum matrix, and available resources
 - Calculate need matrix ($\text{need}[i,j] = \text{max}[i,j] - \text{allocation}[i,j]$)
2. Safety Check Algorithm:
 - Initialize working vector with available resources
 - Create `finish[]` array initialized to false for all processes
3. Find Safe Sequence:
 - Find an unfinished process where $\text{need} \leq \text{work}$
 - If found:
 - Add process to safe sequence
 - Mark process as finished
 - Release its resources ($\text{work} = \text{work} + \text{allocation}$)
 - Repeat until all processes complete
 - If not found at any point, system is not in a safe state
4. Check Result:
 - If all processes can complete, system is in a safe state
 - Output the safe sequence

Resource Management

The program properly manages system resources:

- Opens input file for reading resource data
- Allocates memory for matrices and vectors as needed

- Properly deallocates resources at program termination

Compilation and Execution

To compile the program:

```
g++ banker.cpp -o banker
```

To run the program:

```
./banker
```

Sample Output

Attempt 1 and Success

```

91  int main() {
161  for (int i = 0; i < processes; i++) {
166      cout << endl;
167  }
168      cout << endl;
169  }
170  // Check if system is in a safe state
171  vector<int> safeSequence(processes);

```

```

P4 0 0 2

Maximum Matrix:
A B C
P0 7 5 3
P1 3 2 2
P2 9 0 2
P3 2 2 2
P4 4 3 3

Need Matrix:
A B C
P0 7 4 3
P1 1 2 2
P2 6 0 0
P3 0 1 1
P4 4 3 1

Process P1 runs to completion.
Resources released: 2 0 0
Available resources: 5 3 2

Process P3 runs to completion.
Resources released: 2 1 1
Available resources: 7 4 3

Process P0 runs to completion.
Resources released: 0 1 0
Available resources: 7 5 3

Process P2 runs to completion.
Resources released: 3 0 2
Available resources: 10 5 5

Process P4 runs to completion.
Resources released: 0 0 2
Available resources: 10 5 7

THE SYSTEM IS IN A SAFE STATE
Safe Sequence: P1 -> P3 -> P0 -> P2 -> P4
(pjyasee@wasp banker)$

```

Notes and Observations

- The system is in a safe state because there exists at least one sequence in which all processes can be executed to completion without deadlock.
- The algorithm prioritizes processes that can complete with the currently available resources.
- The step-by-step execution clearly shows how resources are released and reallocated during the safe sequence.
- The final available resources match the total resources in the system, confirming that all processes have completed and released their allocations.
